Lambda PRL2 is a cDNA library derived from equal
quantities of 4 pools of mRNA. The mRNA sources were 1) 7
day germinated etiolated seedlings; 2) tissue culture
grown roots; 3) staged plants half with 24 hour light
same plants as 3 but aerial tissue (stems, flowers and
sliques. The vector is BRL's lambda Zip-Lox. The cDNA
librars were directionally cloned with Sal-Not arms using

```
New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Zyskind JW;

polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation. (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibites cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibite proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound a activity; (11) a culture compound strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required cor collection of an organism. The antisense modeled for rational and all and all and an organism of the candidate molecules for regional
                                                                                                                                                                                                                                                                                                                                                                              drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New genomic sequences from Listeria species, useful for detection, treatment and prevention of infection, also related polypeptides, antibodies and modulators.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antibacterial; Listèria; food contamination; mutational analysis; infection; ds.

                         ABQ71212) from Listeria sp. The sequences are useful as probes and primers for identification and/or detection of Listeria (e.g. as contaminants in foods, or mutational analysis) and for analysis of gene expression. Proteins encoded by the nucleic acid sequences can be used to screen for compounds that modulate gene expression, replication and pathogenicity of Listeria (potential therapeutic agents), also for treating infections by Listeria, and are useful as immunogens in anti-listeria vaccines. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fip.wipo.int/pub/published_pot_sequences. (Updated on 29-AUG-2003 to standardise OS field)

(HUMA-) HUMAN GENOME SCI INC

Rosen CA, Barash SC, Ruben SM;

WPI; 2001-483426/52

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.

Disclosure; SEQ ID NO 36971; 3071pp + Sequence Listing; English.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

C anino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic

activity, and can be used in gene therapy and vaccine production. (I)

C proteins and polynucleotides may be used in the prevention, diagnosis and

CC treatment of diseases associated with inappropriate (I) expression. For

cxample, they may be used to treat disorders associated with decreased

CC example, they may be used to treat disorders associated with decreased

CC expression by rectifying mutations or deletions in a patient's genome

CC explession by rectifying of (I) by expressing inactive proteins or to

c upplement the patients own production of (I). Additionally, (I)

C supplement the patients own production of (I). Additionally, (I)

C polynucleotides may be used to produce the secreted (I), by inserting the

CC mocleic acids into a host cell and culturing the cell to express the

C protein. (I) proteins and polynucleotides may be used to prevent,

C diagnose and treat immune/haematopoietic-derived cells. AAK64703

CC cancers and cancer metastases of haematopoietic-derived cells. AAK64703

CC cancers and cancer metastases of haematopoietic antigen genomic

C to AAK8764 represent human immune/haematopoietic antigen genomic

C represent sequences used in the exemplification of the present invention

the invention fractors of an interior actual compilating any one of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a promoter operably linked to the nucleic acid encoding a promoter operably linked to the nucleic acid encoding a proposession is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated continued by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting callular contiferation or the activity of a gene in an operon required for proliferation or that has an acitivity against a biological pathway or that has an activity against a biological pathway or that has an activity against a biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, activity; (11) a culture comprising strains in which the extent or product is overexpressed or underexpressed; (12) determining the extent compound, activity; (11) a culture comprising strains in which the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the content of the strains is present in a culture or collection of strains; or (13) identifying proteins or screening for homologous nucleic acids required for encounted for fartional activity descending for homologous nucleic acids required for encounted for encounted for encounted for encounted for fartional actional actions of the strains is present in a culture compound.
                                                                                                                                                                                               New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     present sequence is one of the target
the sequence data for this patent did
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  drug discovery programs, or for screening homologous nucleic acids
required for proliferation in cells other than S. aureus, S. typhimurium,

The present invention relates to an isolated polymucleotide, comprising CC polymorphisms in the human diphtheria toxin receptor, heparin-binding compidermal growth factor-like growth factor (DTR) gene. DTR gene is cotated on chromosome 542: The polymucleotide comprising polymorphisms cc in the DTR gene is useful in studying the expression and function of DTR, and in expressing DTR protein for use in screening candidate drugs to treat diseases related to DTR activity. The methods and haplotypes are useful in improving the efficiency and output of several steps in the cuseful in improving the efficiency and output of several steps in the cuseful in improving the efficiency and output of several steps in the care diseases are setful for determining if an individual has one of the cuseful for determining if an individual has one of the cuseful for studying expression of the DTR isogenes in vivo, for in vivo screening cand testing of drugs targeted against DTR protein, and for testing the efficacy of therapeutic agents and compounds for tumour growth, smooth cefficiacy of therapeutic agents and compounds for tumour growth, smooth cuseful byperplasia or atherosclerosis in a biological system. The present companies of DTR general and processing the present companies of DTR general and processing the present companies of DTR general and processing the present companies of DTR general and processing the present companies of DTR general and processing the present companies of DTR general and processing the present companies of DTR general and processing the present companies of DTR general and DTR general and processing the present companies of DTR general and DTR general and DTR general and DTR general and DTR general and DTR general and DTR general and DTR general and DTR general and DTR general and DTR general and DTR general and DTR general and DTR general and DTR general and DTR general and DTR general and DTR general and DTR general and DTR general and DTR general and DTR general and DTR general and DTR general and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     a

                                                                                                                                                                                                                                                                                                                                          New nucleotide polymorphisms in the human diphtheria toxin receptor, heparin-binding epidermal growth factor-like growth factor (DTR) gene, useful for screening or expressing proteins for treating diseases related to DTR activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                             polymorphisms in the human diphtheria toxin receptor, heparin-binding epidermal growth factor-like growth factor (DTR) gene. DTR gene is located on chromosome 5q23. The polymorlectide comprising polymorphisms in the DTR gene is useful in studying the expression and function of DTR, and in expression and function of DTR, and in expression and function of DTR, and in expression and thoughton to treat diseases related to DTR activity. The methods and haplotypes are useful in improving the efficiency and output of several steps in the drug discovery and development process, including target validation, identifying lead compounds, and early phase clinical trials. The kit and method are useful for determining if an individual has one of the haplotypes or haplotype pairs. The transgenic animals are useful for studying expression of the DTR isogenes in vivo, for in vivo screening and testing of drugs targeted against DTR protein, and for testing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             and testing of drugs targeted against DTR protein, and for testing the efficacy of therapeutic agents and compounds for tumour growth, smooth muscle hyperplasia or atheroscierosis in a biological system. The present sequence is human DTR gene allelic variant

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

C amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)

CC proteins and polynucleotides may be used in the prevention, diagnosis and

CC treatment of diseages associated with inappropriate (I) expression. For

C example, they may be used to treat disorders associated with decreased

CC example, they may be used to treat disorders associated with decreased

CC expression by rectifying mutations or deletions in a patient's genome

CC explession by rectifying mutations or deletions in a patient's genome

CC cupters affect the activity of (I) by expressing inactive proteins or to

CC polynucleotides may be used to produce the secreted (I), by inserting the

CC polynucleotides may be used to produce the secreted (I), by inserting the

CC protein. (I) proteins and polynucleotides may be used to prevent,

CT diagnose and treat immune/haematopoietic-related diseases, especially

CC cancers and cancer metastases of haematopoietic-derived cells. AAK64703

CC cancers and cancer metastases of haematopoietic-derived cells. AAK64703

CC cancers from the present invention. AAK54912 to AAK54950 and AAM82169

CC represent sequences used in the exemplification of the present invention
                                                                                                                        Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Zhou Q, Aux GW;

vegetation, comprises combining a polypeptide with a compound to be tested for the ability to bind to the polypeptide or inhibit the activity Identifying an herbicidal compound, useful for controlling undesirable Example 9; SEQ ID NO 79; 273pp; English. the polypeptide.

The invention relates to a method for identifying a herbicidal compound.

The method of the invention comprises combining a polypeptide having at least 90% identical to any one of 48 69-1008 residue amino acid sequences (designated as P1-P48), given in the specification, with a compound to be tested for the ability to bind to the polypeptide or inhibit the activity of the ability to bind to the polypeptide or inhibit the activity of the polypeptide, under conditions conductive to binding or inhibiting, respectively. Also disclosed is a method for killing or inhibiting the growth or viability of a plant by applying to the plant the herbicidal compound identified by the novel method, a chimeric construct comprising a promoter operatively linked to the nucleic acid molecule. The method and polypeptides are useful in secree and molecule. The method and polypeptides are useful in a screening assays to identify compounds that interact or inhibit the polypeptides, thus as potential herbicides to control undesirable comprising nucleotide sequences that encode proteins (even numbers between ADB95003) and ADB95097) isolated from Arabidopsis thaliana comprising nucleotide sequences that encode proteins (even numbers) between a ADB95009) are essential for plant growth and development

Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA.

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligomelectides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used:

(i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the method in the Claim 12; 56pp + Sequence Listing; 56pp; German. disclosure of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       18-JUN-1999
            This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic cytosine (C) but not methylated C, to uracil, then part of the genomic cytosine (C) but not methylated C, to uracil, then part of the genomic convertance of the amplicon is hybridised to two classes, each with at least one member, convertance of bybridisation to both classes is determined from the label on degree of hybridisation to both classes is determined from the label on control standard. The method is used: coligomers, the degree of methylation is calculated. The method is used: coligomers, the degree of methylation is calculated. The method is used: coligomers, the degree of diseases, e.g. cancer, disorders of the central correvous, cardiovascular, gastrointestinal and respiratory systems etc., nervous, cardiovascular, gastrointestinal and respiratory systems etc., cand of a wide range of diseases, e.g. cancer, disorders of the central control in the control control in the control control in the method allows the method allows the method allows the method allows the method allows the method allows the method in the control control in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                             ö

(FROM/) FROMMER W.

Gillissen B, Buerkle L, Andre B, Frommer WB;

WPI; 2000-566202/53. N-PSDB; AAA97919 Nucleic acid, useful for producing transgenic plants with altered nucleobase transport, encodes a nucleobase transporter protein of Arabidopsis thaliana.

Claim 1b; Page 16-17; 24pp; German.

This invention describes a novel nucleic acid encoding a plant nucleobase transporter (1) (1) is produced by complementation of a nucleobase transport (NBT)-defective host cell with a plant gene bank by selection of NBT-positive cells. (1) is used to isolate homologous sequences from bacteria, fungi, plants, animals and humans, for expression of the exoded protein (11) in prokaryotic or eukaryotic cells, for inhibiting expression of (11) in prokaryotic plants have modified nucleobase transgenic crop plants. The transgenic plants have modified nucleobase transport properties, e.g. altered affinity and substrate specificity that may result in more efficient nucleobase transport properties, endicated affinity and substrate specificity that may result in more efficient nucleobase transport in leaves, changes in apical dominance, flowering behaviour and senescence, or improved distribution of pesticides. This sequence represents the Arabidopsis

nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as
                                                                                                                                                                                                                                                                                                        CFREKFQAEKGVSLLLSLWGFVSYFYGEFKSG--KKVVDKPQPPETELPIL--PVSD 353

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 9580, Application US/09489039A

Patent No. 6610836
GENERAL INFORMATION:
APPLICANT: Gary Breton et. al
APPLICANT: Gary Breton et. al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA
TITLE OF INVENTION: NUCLEIC ACID AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US/09/489,039A
CURRENT FILING DATE: 2000-01-27
PRIOR PILIAGION NUMBER: US 60/117,747
PRIOR PILIAGION NUMBER: US 60/117,747
NUMBER OF SEQ ID NOS: 14342
                                                                                            15;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   72 NKRKTKLFLMETPLFIASIVIGLL-TGLDNYLYSYGLAYLPVSTSSLIIGTQLAFNALFA 130

Sequence 7659, Application US/09328352

Batent No. 6562958

GENERAL INFORMATION:
APPLICANT: Gary L. Breton et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTC99-03PA
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT FILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
SEQ ID NO 7659
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 4974, Application US/09328352
